

NAMING SYSTEM

Snake case naming system will be used for the entire data warehouse. Lower case with ‘_’ as separator. Eg: customers_details

Table Naming Convention

1. **Bronze Layer:** All names must start with schema name and table name must match their original names without renaming. Eg: bronze.customers
2. **Silver Layer:** All names must start with schema name and table name must match their original names without renaming. Eg: silver.customers
3. **Gold Layer:** All names must use meaningful business-aligned names for tables, starting with the category (dimension, fact table, aggregation, report etc) prefix. Eg: dim_customers or fact_sales or agg_customers

Column Naming Convention

1. **Surrogate Keys:** All primary keys in dimension tables must use the suffix _key. Eg: customers_key
2. **Technical Columns:** These are columns added to the table and do not come from the source columns. All tech columns must start with the prefix dwh_ followed by a descriptive name indicating the column’s purpose. Eg: dwh_load_date

Stored Procedure

All stored procedures used for loading data must follow the naming pattern: load_<layer>. Eg: load_bronze, load_silver.

ANALYSIS ON SOURCE DATA

1. Who owns the data?
2. What business Process does the source support?
3. Ask about the system and data documentations used
4. Understand the data model and catalog to understand the columns and the likes
5. Understand how the data is stored
6. What are the integration capabilities? api, file extractions, direct connection, etc
7. Incremental or full load?
8. Understand the data scope and historical needs
9. What is the expected size of the extracts?
10. Are there any data volume limitations?
11. How to avoid impacting the source system’s performance?
12. Authentication and authorisation?
